

Lifeline ARM Hands-Free CPR Device

QuadMed is proud to introduce the Lifeline ARM Automated Chest Compression (ACC) device, a mechanical solution to performing cardiopulmonary resuscitation (CPR). When it comes to CPR, the quality and speed of each and every compression is critical. The Lifeline ARM, with its intuitive user interface and automated operation, ensures effective CPR with compression depth and rate as recommended in current AHA/ERC guidelines. In an emergency situation, CPR efficacy is ensured, and the rescuer is freed for other interventions and tasks.

CPR has a measurable statistic called CCF which means “chest compression fraction.” It is the percentage of time in which chest compressions are done by rescuers during a cardiac arrest. CCF drops if there are interruptions or pauses in CPR, which may be due to other rescue related activities, even if they last only 2-3 seconds. Greater CCF can impact survival.

CPR efficacy is attainable with Defibtech’s latest technical innovation, the Lifeline ARM, an automated solution for providing mechanical CPR. Time is of the essence in a rescue. The superior design of the Lifeline ARM results in easier assembly, fewer steps, minimal interruptions, and robustness during operation. Using a state-of-the-art compression module paired with an exceptionally designed frame, the Lifeline ARM offers superior value, powerful features, functions, and ease of use in its solution for hands free CPR. Designed for the ruggedness and durability demands of the professional first responder, the Lifeline ARM provides portability and quick deployment. High-quality CPR is ensured, and the rescuer is freed for other interventions and tasks. The result is a truly useful product to help save lives.

Item #	Description	Price
EAW-207321	Lifeline ARM System.....	\$12995.95

Includes: Lifeline ARM, Carrying Case, Battery, Compression Piston, 3 Pads and Charging Cable

*Fully assembled system.
Lightweight, portable design.*

*Backpack-style carry case.
Stores and protects components.*

*Replacement patient pads.
Inexpensive and easily replaced.*

*Compression piston.
Simple to use operation.*
